"Figure 1 to Supplement No. 2, FER-76. Annotated map of the principal recently active strands of the Wildomar and Wolf Valley faults of the Elsinore fault zone. Data are based on the stereographic interpretation of aerial photos of the U.S. Department of Agriculture (1953), U.S. Geological Survey (1975), and Fairchild (1939)."

The fault traces shown on this plate are recent and well-defined. For the most part, they coincide with the main trace of Kennedy (1977; see figure 2a this ~~report~~ FER-76). Other faults portrayed by Kennedy were not readily identifiable on the air photos and, therefore, are not recommended for zoning under the Alquist-Priolo Special Studies Zones under present guide lines. Data by R.B. Saul, April 1979.
