B = bench (line along back edge)
BIS = break in slope
BHD = beheaded drainage
BTD = be-toed drainage
CD = closed depression
DD = deflected drainage (right lateral)
LT = linear trough or trench
LD = linear drainage
SP = sag pond
SR = shutter ridge
TON = tonal lineament
= scarp, usually drawn along base of escarpment; hatchures point in direction scarp is facing

outline of landslide mass (only selectively shown); arrow indicates direction of movement.

FER 101.

Figure 6 . Geomorphic and tonal features along recent traces of the Hayward fault; Richmond quadrangle.

Solid line indicates well-defined feature, very probably produced by fault movement (except as noted).

Dashed line indicates less well-defined, discontinuous, or broad feature, but still probably due to recent fault movement.

Queried line indicates vague linear features of uncertain origin.
