
FER-150. Figure 5A. Fault-related features and diagnostic geomorphic surfaces in the Grapevine quadrangle visible on U.S. Department of Agriculture (1952) aerial photographs. Solid line indicates feature or contact appears well-defined; dashed line indicates features or contacts are less well-defined.

= scarp, well-defined, clearly offsets geomorphic surface; most probably fault-produced; dashed where approximately located

= scarp or escarpment which appears to coincide with a contact between two different rock units; may be fault produced

= contact, well-defined and accurately located

= contact, poorly defined or approximately located

t = tonal lineation

Qa = alluvium (probably Holocene)

Qof = older alluvial fan deposits (probably Pleistocene)

= landslide deposits (selectively shown)
